

Systems engineer with 15+ years in Linux kernel networking, hardware-offload acceleration, and performance-critical C development.

Skills

Languages	C, C++, Go
Kernel & networking	Linux kernel internals, eBPF/XDP, Netfilter, TCP/IP/IPv6 stack, SDN, systemd, D-Bus/varlink, cgroups & namespaces, containers
Performance & acceleration	Hardware-offload architectures, kernel/network profiling and benchmarking, block I/O, embedded firmware
Tooling	Git, GDB, perf, tcpdump, QEMU, Docker, Yocto Project

Work experience

October 2022–current	Senior Software Engineer, Meta, Milan ○ Upstream systemd development ○ Work on servers storage management in Twine (formerly Tupperware), Meta's managed deployment system for internal backend services ○ Built <i>krebaser</i>, a CI tool that continuously rebases downstream Linux kernel patches against upstream master and builds the result, catching integration breakage before the test pipeline runs Achievements: ○ Led the fleet-wide migration from fb-oomd to systemd-oomd, upstreaming core logic (PR #38584, PR #40615) and staging the rollout across the fleet ○ Implemented BPF token support in systemd (PR #36134), enabling delegated, unprivileged BPF program loading for containerized workloads ○ Led the CentOS 10 migration of RPM copy-on-write storage optimizations, porting the implementation from C to C++ and the accompanying DNF plugin from Python to C++, extending support beyond the original CentOS 9, x86-only implementation to include ARM architectures
June 2020–September 2022	Senior Software Engineer, Microsoft, Milan ○ Linux kernel development in the Azure network team ○ Network traffic acceleration ○ Yocto Project firmware development Achievements: ○ Launch of Azure Boost, a dedicated hardware to offload virtualization processes from the hypervisor and the host OS ○ Wi-Fi scan support for WSA (Windows Subsystem for Android) ○ Pushed upstream the global counter for the Linux block devices
July 2017–May 2020	Senior Software Engineer, Red Hat, Milan ○ Linux kernel development ○ Open vSwitch development ○ iproute2 upstream development ○ Working with TCP/IP, IPv6, Netfilter, eBPF, XDP on a daily basis ○ Solving networking problems with containers and namespaces Achievements: ○ Assisted two of the largest carriers during their 5G network rollouts ○ 100+ commits upstream to the Linux kernel

- June 2016– **Senior Software Engineer**, *Canonical*, Remote
- April 2017
 - Linux kernel/userspace development on Ubuntu and Ubuntu Core
 - Snap ecosystem (snapd, snapcraft, store)
 - Go software development**Achievements:**
 - Development of Snap, a containerized, transactional package manager
 - Wake-on-WLAN support for the Dell Edge Gateway
- June 2014– **Senior Software Engineer**, *ADB Broadband (formerly Pirelli Broadband Solutions)*, Milan
- May 2016
 - Wi-Fi Linux driver development
 - Firmware development for consumers and small business CPE (customer premises equipment)
 - Development of appliances firmware**Achievements:**
 - Rollout of the Swisscom Centro Business CPE
 - Rollout of Fastweb Wow Fi service
- July 2009– **Software Engineer**, *Fluidmesh Networks (now Cisco)*, Milan
- May 2014
 - Firmware development on embedded platforms
 - Linux Wi-Fi and Ethernet driver development
 - Implementation of custom network protocols
 - Automated testing with *Selenium*
 - FCC and ETSI certification process and hardware debugging with specialized lab tools**Achievements:**
 - Rollout of the Fluidmesh Mito and Volo product lines
 - Development of a remote CLI interface for system administration

Open source software contributions

open source projects and communities

- Linux Kernel contributor
- Active in the Linux and open source community
- OpenWrt maintainer
- Contributed to various OSS projects (*iproute2*, *coreutils*, *busybox*, *sane*, *pppd*...)

Talks

- 2025 **BPF Tokens in systemd**, *All Systems Go*, Berlin
- 2025 **RPM Copy-on-write**, *CentOS Showcase*, Virtual

Languages

- Italian Native
- English Professional proficiency
